SIRENEN
LICHTINSTALLATION, OFFENBACH, 2016

Sirenen (2016) Offenbach

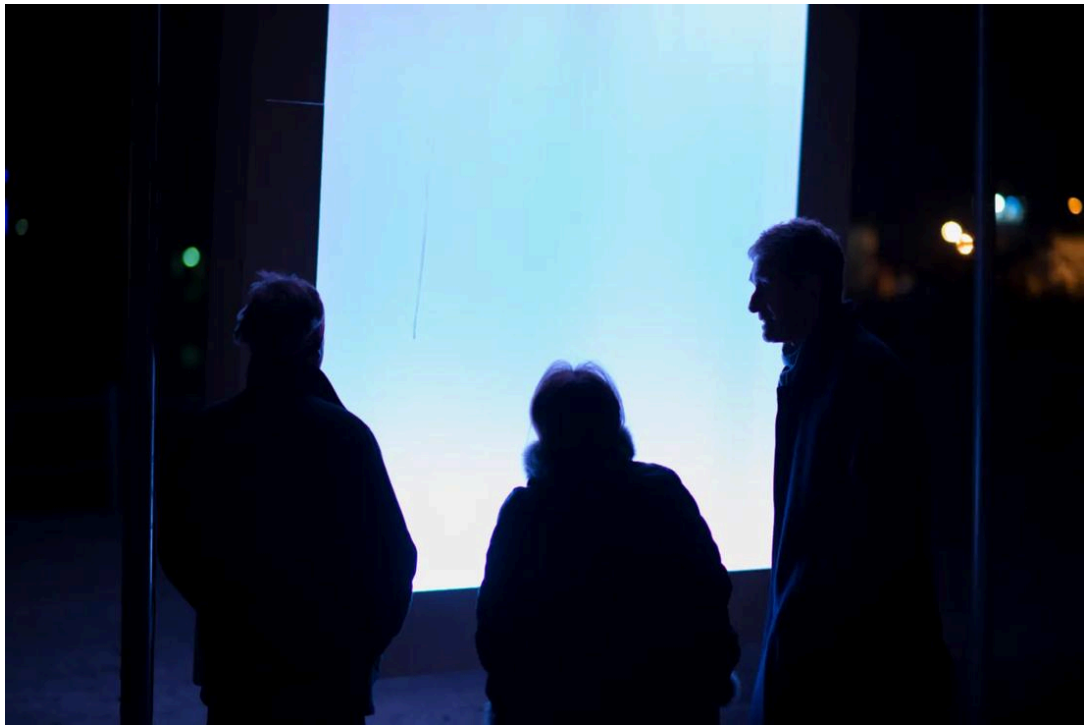

YRD.Works developed the light installation Sirenen (Sirens) for Offenbach's Hafeninsel on the occasion of Luminale 2016, a spit of land where the Main divides into two arms, one of which leads into the harbour basin. In a certain sense, it was a follow-up to Makoko, the floating light installation the collective had shown in the Offenbach harbour basin at Luminale two years earlier. The title plays on the double meaning of the word: in myth, the sirens sit by the water and lure passing sailors; as a technical signal, the siren warns. The panels at the tip of the spit did both at once, much like a lighthouse that draws the eye while giving orientation. What interested YRD.Works above all was light as a signal and as a form of communication. The installation consisted of five double-sided light panels measuring 3 x 5 metres, lined up at the very tip of the spit and shining onto both arms of the Main. Suspended from metal poles set in concrete in the ground, they moved freely in the wind thanks to their large surface. Programmed light sequences ran via a DMX controller, with which the panels sent signals to passing ships and to viewers on the bank.
