BUSY SCULPTURE
SKULPTUR, OFFENBACH, 2017

Busy Sculpture is a water wheel capable of generating cryptocurrency. The wheel can convert the kinetic energy of a river into electricity and use it to run a computer (a "miner") that verifies transactions on a blockchain. These verifications are rewarded in the respective cryptocurrency, allowing the sculpture to earn its own income. Busy Sculpture can be connected to a blockchain via a mobile internet stick and so participate in a global financial network from the most remote places. Among other things, the sculpture serves as a blueprint for the possibility of a new, decentralised form of energy generation, since it is not tied to a location and the electricity it produces can be converted into crypto money without losses from long transmission lines. At the same time, Busy Sculpture is an economic perpetual motion machine, as the coins earned in our model are just enough to cover the cost of the internet stick — so the sculpture, in a sense, generates money for its own sake.
