## DISPLAY (NODE E.V.)

RAUMKONZEPT / MÖBELSYSTEM, FRANKFURT, 2025

*Display (Node e.V.)* (2025) Frankfurt

Display is a spatial concept developed in 2025 and realised in 2025–2026 for the City of Frankfurt's Digitalisation Unit and Node e.V. The brief was to create a meeting point and place of mediation for digital topics in the centre of Frankfurt — a room that would be workshop, venue and public interface at once. YRD.Works responded with a concept that allows for both structure and variation and can evolve with its use.

The starting point was the grid: as a basic design figure that holds modules and organises their combination, and at the same time as a reference to digital logics in which meaning arises from the arrangement of the smallest units. References such as OpenStructures, the historic punch card and the Märklin metal construction kit make this kinship explicit. The grid thus became the connecting element between analogue workshop and digital content — an ordering principle that makes the room legible without fixing it.

In concrete terms, the concept was realised as a modular system of perforated timber battens. A uniform grid of 9 mm holes at 5 cm spacing runs through all furniture and spatial elements: shelving, an extendable grandstand that disappears into the shelving and opens into a landscape of steps when needed, modular flex desks that hook into the batten structure, a tiny makerspace and a central bar. All elements follow the same logic and can be extended, rebuilt or recombined. Based on this system, the room's three main modes of use — event, co-create and workshop — can be switched by moving just a few modules; in the basement, an archive and media store, an open lab and a retreat room complement the public level.

A second layer of the concept lies in the shop window facing Kornmarkt, which is fitted with electronically switchable privacy film. Switched on, the glass turns opaque and becomes a projection surface for content visible from inside and out; switched off, it turns transparent and opens the view into the room, which thus becomes a stage for the public itself. The title lies in this ambiguity: Display refers at once to the digital screen, the shop window and the room as a showcase of its own activity.

The colour and lighting design continues this logic. A consistent colour pairing of traffic blue (RAL 5017) and traffic green (RAL 6024) orders the system visually and makes the modules recognisable as a family regardless of furniture type. Dimmable base lighting close to daylight forms the functional background, to which modular lights can dock and adapt to each use — task lighting during the day, accent and event lighting in the evening.

Display is therefore less a finished, furnished room than an infrastructure that grows with its use. The grid remains as the underlying order, the furniture is variable, the shop window conveys the inside to the outside — structure and freedom lie within the same system.
